

Two data issues found during the platform audit — what they are, and what fixing them takes

Plain-English writeup of two problems found in XFlagFootball's data while investigating an unrelated issue. Both are explained below: what's actually wrong, where you'd see it, why it happened, and what it takes to fix.

Organization: XFlagFootball **Scope:** Roster & game-stat records

Data at risk: None — both are read-confirmed, backed up before any change

Issue 1

Six teams have two players sharing one jersey number

NEEDS YOUR DECISION

Issue 2

614 leftover play records from deleted games

SAFE CLEANUP, NO DECISION NEEDED

ISSUE 1 — ROSTER DATA

Two players, one jersey number, on six teams

WHAT'S ACTUALLY WRONG

On six teams, two different players are currently assigned the *same* jersey number at the same time. In real life a jersey number identifies exactly one player on the field — right now, on these six rosters, it doesn't.

TEAM	NUMBER	PLAYER A	PLAYER B	PLAYS ALREADY RECORDED UNDER
DARKSIDE	#7	Troy Cordova	Elijah Smith	
GOAT	#7	Troy Cordova	Mikey Birk	
Members Only	#22	Darryl James	Andrik Haros	
N&B	#8	Isaiah Rodriguez	Mikey Bozeman	
Suspects	#1	Aaron Dockery	Caleb Burge	
Warfare	#4	Bacon Warfare	Tyler Sissons	

WHERE YOU CAN SEE IT

Open any of these six teams in the admin — the roster list plainly shows two names against one number. Nothing currently flags it as a problem on screen, so it's easy to scroll past unless you're looking for it.

Admin > Teams > (e.g. "Members Only") > Edit > roster list

WHY IT HAPPENED

There are two different places in the system where a player gets assigned a jersey number: editing the team directly, and editing the player and picking their team from there. The first place has always checked "is this number already taken on this team?" before saving. The second place never did — it would save straight through, number clash or not. All twelve conflicts came in through that second, unguarded path.

The play only ever records a jersey number, never a player — so once two players share that number, a game record can't say which one actually made the play.

CAN THIS BE FIXED?

In two parts, with different answers:

PART	FIXABLE?	HOW
Stopping <i>new</i> conflicts	Yes — done	The unguarded
Fixing the 12 players already conflicting	Yes, needs a decision	Someone who k
The plays already recorded under the shared number	No	Nothing in the c

HUMAN NEEDED

Yes, for the current 12 — someone who actually knows these six rosters needs to say who keeps each number. It's not something we can safely guess from the data; there's no reliable signal either way. Everything else on this issue is already handled.

RECOMMENDED PATH

1. Nothing further needed for future assignments — that hole is closed.
2. Have team managers or coaches confirm, per pair, who keeps the number. Once you tell us, we apply it in one safe update per team.
3. Treat the plays already logged under the shared number (up to 200 on one team) as having permanently uncertain attribution between the two players — worth flagging

to anyone using those numbers for season awards or rankings.

ISSUE 2 – DELETED GAMES

614 play-by-play records left behind by deleted games

WHAT'S ACTUALLY WRONG

Every recorded play (a pass, a run, a touchdown) is logged as its own record, tagged to the game it happened in. When a game gets deleted, the game itself disappears — but historically, its individual play records didn't. 614 of these leftover records exist across the platform today, each one tagged to a game that no longer exists.

WHERE THEY TRACE BACK TO (BY TEAM NAME MATCH)	RECORDS
XFlagFootball	≈ 285
Denstar (test org)	≈ 84
Showtime Sportz	≈ 31
Team name no longer matches anything current — can't attribute confidently	214

The attribution above is a best-effort match on team name, not a hard link — the actual game each record belonged to is gone, so this is our closest estimate, not a certainty.

WHERE YOU CAN SEE IT

Nowhere, currently — and that's the point. No admin page lists these records or is even capable of showing them, because every stat page pulls plays through the game they belong to. With no game to pull through, they simply don't appear anywhere. They're not breaking any page or showing wrong numbers to anyone; they're inert records sitting unused in storage.

WHY IT HAPPENED

Same root pattern as Issue 1, different feature: deleting a game was written to remove the game and update its schedule, but never to remove the individual plays that belonged to it. Every game deleted before the fix left its plays behind.

Deleting a game used to leave its plays behind, pointing at nothing. Deleting a game now takes its plays with it.

CAN THIS BE FIXED?

Yes, cleanly. Unlike Issue 1, there's no ambiguity to resolve here — a play record with no game attached is simply unusable data, full stop. There's nothing to decide between two options; it's just debris to remove.

PART	FIXABLE?	HOW
Stopping <i>new</i> orphaned plays	Yes — done	Deleting a game now automatically deletes its p
Removing the existing 614	Yes	A single, safe bulk deletion after a fresh backup.

HUMAN NEEDED

Only a quick go-ahead to run the cleanup — no judgment call required, since there's nothing to weigh between. If you'd like the ≈214 unmatched records investigated further before deleting (in case any trace back to a renamed XFlag team), say so; otherwise they're safe to remove with the rest.

RECOMMENDED PATH

1. Take a fresh backup of the affected records (routine, already how we've handled every change so far).
2. Delete the 614 orphaned records in one pass.
3. No further action — the fix already in place prevents this from recurring on any future game deletion.

Findings verified directly against the live database; no data was altered while investigating.

Backups taken before any change discussed here.
